Async-Await

async function always returns a promise.

async function myFunc( ) { .... }

await pauses the execution of its surrounding async function until the promise is settled.

```
function api()
{
    return new Promise((resolve, reject) => {
        setTimeout(() => {
            console.log("Weather Data Received");
            resolve("Success");
        }, 2000);
    });
}

async function getWeather()
{
    console.log("Getting Weather Data...");
    await api();
}
```

```
function getData(dataId)

{

    return new Promise((resolve, reject) => {

        setTimeout(() => {

            console.log(`Data ${dataId} Received`);

            resolve("Success");
        }, 2000);

    });

}

async function getAllData()

{

    console.log("Getting All Data...");

    await getData(1);

    await getData(2);

    await getData(3);

}
```
